

WHAT TO DO

IF A COYOTE
APPROACHES YOU:

STOP;

STAND STILL;

SHOUT — GO AWAY!

wave your arms high in the air;

***SLOWLY* back away — never
*run from a coyote (or a dog)***

Coyote Watch Canada is a non-profit organization dedicated to providing education and research about the Eastern Coyote. Coyote Watch Canada advocates positive human and wildlife experiences through wildlife protection, conflict resolution (hazing and community outreach), field observations, data collection, and community-based education and conservation awareness initiatives about coexisting with the coyote.

*“All things are bound together.
All things connected.”*

SUCCESSFULLY COEXISTING WITH THE COYOTE:

[1] NEVER feed coyotes* [2] Always keep pet food and water bowls indoors [3] Keep trash cans covered [4] Pick ripened fruit, and clean all rotted fruit off the ground [5] Do not allow a large amount of wild bird seed to remain on your lawn [6] Keep your pets leashed [7] Keep cats indoors [8] Keep chickens, rabbits, and other small animals in covered enclosures, constructed with heavy mesh wire [9] Neuter pets [10] Never approach coyotes, their dens or their pups [11] Teach children how to respect and safely admire wildlife from afar [12] Hazing techniques have proven successful in deterring coyotes from an area; examples of hazing include: **throwing a shake can (filled with coins) in the coyote's direction; spraying a water hose; or popping an umbrella.**

Trapping coyotes in the city is difficult

Poisoning programmes are illegal in Ontario

Relocation programmes are ineffective because after removing one coyote, another one (or possibly two) may move into that habitat

Expensive eradication/relocation programmes in other parts of North America have proved a failure

Non-lethal coexistence with this fascinating species is the best option

The coyote is also known as the "North American Song Dog". It is cousin to the domestic dog and Eastern Wolf. This interesting species is native to North America. Due to human extermination of wolf populations, the resilient and adaptable coyotes' range extends across Canada and the United States from urban cities and rural landscape.

Coyotes have keen senses, and are aware of all inhabitants and objects in their territory. They are wary of change, and curious about human activities. This would account for sightings where coyote pups are observed playing with discarded pop cans, sticks, and golf balls. Pet dogs may also be drawn into such games. Their play behavior is their survival training.

Coyotes communicate by howling – to locate a lost pack member, mate, or pup; to send information about possible danger; to vocalize with neighboring packs; or to ask for help. Coyote vocalizations can be deceiving; two coyotes can sound like a chorus. Listening to coyotes has convinced most naturalists that coyotes often howl for the pleasure of it, and at times, they howl simply because they are lonely.

The urbanization of green spaces fragments the natural habitat for wildlife. Because of this, the coyote is forced to adapt to living closer to populated urban areas. Human fear, misunderstanding, and the lack of knowledge about coyote behavior (ie. seasonal changes) and habitat have lead to 50-70% of young coyotes being killed by humans before they reach adulthood. Humans often attribute an attack on livestock to a coyote. However, free roaming domestic dogs or feral dogs can contribute to such attacks.

Coyotes are omnivores, and feed on insects, vegetation, fruit, small rodents, carrion, and depending on the climate and habitat, the coyote may also prey on larger animals, such as deer. Any deadstock in rural lands should be cleared immediately.

Coyote alpha pairs often mate for life. They are devoted and diligent parents, with the male directly involved in pup rearing. The size of the home range, on average, can be anywhere from three to fifty square miles. Each coyote pack travels and hunts in its own specific territory which is influenced by the availability of resources and space.

Like wolves, coyotes are considered a vital keystone predator by keeping small mammals and rodent populations in check. Understanding the benefits of coyotes in our ecosystem helps to promote and preserve healthy wild spaces.

The City of Niagara Falls enforces By-Law 2011-37 to discourage the intentional and unintentional feeding of coyotes – with fines up to \$5000.00 CAD
